**Topic: Very Early Onset Inflammatory Bowel Disease (VEO-IBD): Unraveling the mystery**

**Summary:** Very early onset IBD (manifests in the first 6 years of life) is a unique entity described recently and is different in many ways from common garden variety of inflammatory bowel disease (IBD) seen in adults and in children. Pathogenesis of IBD involves a complex interaction of environmental factors, altered immune response in genetically predisposed patients. Common garden variety of IBD is shown to be polygenic disease while VEO-IBD is monogenic disease in which multiple organ systems such as hematology, immunology, endocrinology, dermatology besides gastroenterology are involved. Whole exome sequencing plays an important role in establishing the diagnosis of VEO-IBD. This form of IBD responds poorly to immuno-suppressive/immune-modulatory therapy including biological agents such as infliximab/adalimumab. However, a subset of VEO-IBD is fully cured by hematopoietic stem cell transplantation (HSCT).
